

## Rock Bolt Grouting in Just 5 Minutes with MasterRoc® RBA 380

---

*“No more waiting for cementitious grout to cure. Now we can just drill, inject and mine!”* – Jolyon Jardine, Mine Manager, Kanmantoo Copper Mine, SA.

Recently, at the Kanmantoo Copper Mine in Western Australia, MasterRoc RBA 380, (our fast-reacting (3min), instantly thickening anchoring resin) was successfully injected into a dozen, 9m self-drilling anchors (SDA).

Typically, cementitious grouts are used to encapsulate SDAs, which pose hazards such as dust inhalation and burns to contractors. In waiting for these cementitious grouts to cure, mining teams also lose critical heading for approx. 12 hours.

By choosing the MasterRoc RBA 380, contractors are now able to continue excavating safely almost instantly, as the injection resin reaches >35MPa in just 5 minutes.
